

## Daughter Board and PCI Card Install

The PC required for this version is at least a P4 generation processor and 1 GB of RAM.

There will be a PCI card and daughter card bolted together in the box. Connect the ribbon cable into the 40 pin connector as shown in the photo below. Insert the PCI card into a PCI slot and the daughter card connector into an available back slot.

**Very Important!** Install the 37 pin cable into the daughter card (**BLUE**) connector, **not** the PCI (**BLACK**) connector. The cards have different power and ground pins and the cards will be damaged if connected incorrectly.
